ArcReply

THE PRODUCT

Discover. Understand. Ask.

ArcReply combines a public crypto directory, project research and a workspace for future community AI agents.

For explorers

Find projects and exchanges, read free research, compare evidence and purchase a project-specific premium report.

For project and exchange teams

Prepare approved knowledge in a workspace. Telegram and X integrations are planned for both projects and exchanges.

For advertisers

Sponsor an eligible project or exchange in a clearly labelled spotlight. Sponsorship never buys a research score.

Community AI for every chain. Built on Arc. Independent profiles are not partnerships, verified ownership claims or completed security audits.

ArcReply

THE PUBLIC INDEX

Projects and exchanges. One place.

Switch between crypto projects and exchanges on the homepage or research directory.

Crypto projects

Browse chain and market-cap filters, utility projects and meme tokens. Profiles include official links, dated evidence and available market statistics.

Explore projects >

Exchanges

Browse centralized and decentralized venues using type and KYC filters. Read free reviews of offerings, fees, custody, restrictions and reserve evidence.

Explore exchanges >

New launches

Use the launch radar for newly indexed markets, launch age, liquidity, volume and risk context. A new pool is not necessarily a new token.

Open launch radar >

Coverage is expanding; this is not an exhaustive market list. Market feeds and editorial reviews update separately. Check each timestamp. Unreviewed discoveries do not automatically become premium reports. Research lists 10 projects per page by default, with 20, 50 and 100 options.

ArcReply

FREE AND PREMIUM RESEARCH

Start free. Go deeper for 9 USDC.

Every listed external crypto project has its own free overview and premium deep dive. Exchange research remains free.

Free overview

Read the project purpose, token role, official website and socials, dated market context, selected findings and explicitly unverified claims.

Premium deep dive

Pay 9 USDC once for one project: nine sections, original findings, relevant peers, business and token economics, reproducible scenarios and evidence limits.

Your report library

Sign in, verify your payer wallet and approve the Arc USDC transfer. A confirmed receipt unlocks the saved edition and download, plus future published editions.

Open My reports >

A report is source-based research, not a security certification or investment guarantee. Future published updates are included; no fixed update interval is promised. Failed delivery is eligible for a verified full refund.

ArcReply

FOR PROJECT AND EXCHANGE TEAMS

Your knowledge. Your community.

Teams will manage an AI agent using approved project or exchange information.

01 Find or request a listing

Search by name or supported contract / DEX Screener URL. An unlisted identity can enter discovery or the listing-request flow. Admission and research publication are separate.

02 Sign in and prove control

Use email sign-in and account-bound domain verification. DNS proof establishes domain control; payment and contract selection do not prove ownership.

03 Prepare and connect

Add FAQs, guides and approved sources, then test the workspace. Funded AI and authorized Telegram / X connections are planned; agent-credit payments remain disabled.

Open workspace >

Exchanges can use the same planned agent model for their own communities. A public listing does not mean the venue has connected an agent or endorsed ArcReply.

COMMUNITY AI CHANNELS

Answers where people already ask.

Telegram and X are planned delivery channels for project and exchange agents.

Website - MVP available

Browse research and try saved-source answers. Demo answers do not establish live product performance or make paid AI calls.

Telegram - planned

One shared @arcreplybot, one connected workspace per authorized group. Use /ask@ArcReplyBot or an explicit bot mention. Only that team’s approved sources are eligible. Paid community delivery is not active.

X - planned

A separate shared reply account is proposed; @arcreplyai stays for announcements. Exact verified client account IDs determine context. API access, explicit requests, opt-out controls and prior written X approval are required.

Telegram pilot code is prepared; live delivery still needs credentials and private group tests. X routing is a foundation, not an activated integration. Comparisons must use public research, never another client’s private knowledge.

AGENT CREDIT ECONOMICS

Credits fund actual delivery.

Planned minimum top-up: 29 USDC, with any higher amount. Credits are prepaid usage, not a monthly subscription.

70% AI & delivery budget

Of consumed service revenue: AI inference, channel APIs, payment fees and direct infrastructure. Usage rates must reflect measured delivery costs.

20% Operations

Of consumed service revenue: overhead and operating margin before fixed costs and taxes. This is a target allocation, not guaranteed net profit.

10% Buy + burn reserve

Of consumed service revenue: reserve funds for AREPLY buyback and burn when the verified token route is available. Execution costs fit inside this allocation.

Unused credits remain a customer service liability; do not treat them as profit or burn them. At 29 USDC fully consumed: 20.30 delivery, 5.80 operations and 2.90 buy + burn. Agent payments are not live.

SPONSORED VISIBILITY

A spotlight. Clearly sponsored.

The first offering is a fixed-price placement per chain: 199 USDC for 7 days, subject to eligibility and slot availability.

Projects and exchanges

Both eligible crypto projects and exchanges can request sponsored visibility. An unlisted profile should request a listing before booking.

Explore spotlight >

A separate placement

Up to three labelled placements appear above organic results. Payment cannot change research scores. Placement is defined; impressions, clicks and customer conversions are not guaranteed.

Fixed now. Bidding later.

The pilot uses up to three fixed-price sponsored slots per chain, allocated first come, first served. Bidding is a future feature and is not currently implemented.

199 USDC / seven days / three slots per directory. Customer collection requires passed operator checks and the owner release switch. Receipts stay reserved until completed placement delivery is attested; then 50% company / 50% burn. The private 1-USDC, five-minute pilot earns neither.

LAUNCH A TOKEN

Choose a chain. Use its launchpad.

Compare documented providers by chain. Some official apps can open inside ArcReply; others require their own browser tab.

Choose your provider

Arc: Argus. Solana: Pump.fun, Raydium LaunchLab, LFJ Token Mill and PinkSale. Robinhood Chain: pons. Entries include logos and official references.

Open the launch hub >

More chain choices

Flaunch: Base, Ethereum, Arbitrum and Robinhood. Clanker: Base and Arbitrum. BNB Chain: Four.meme, Flap and PinkSale. PinkSale also documents Polygon, Avalanche and Sui.

After the launch

Return with the contract to request a listing and research coverage. Prepare agent knowledge or explore spotlight. Launching does not automatically publish research or activate an agent.

Embedded views load a third-party app only after your click. Wallet behavior is not a funded-tested native integration. Some providers block frames. Provider fees are separate from ArcReply allocations; ArcReply does not collect a launch fee.

WHERE PAYMENTS GO

Two products. One 50 / 50 split.

Premium deep dives and delivered spotlight placements use a different allocation from agent credits.

Premium report - 9 USDC

After settlement and successful delivery: 4.50 USDC company income before costs and 4.50 USDC reserved for AREPLY buyback and burn.

Spotlight - 199 USDC

After settlement and successful placement: 99.50 USDC company income before costs and 99.50 USDC reserved for AREPLY buyback and burn.

Tracked separately

The private finance ledger separates report receipts, spotlight receipts, customer credit liabilities, delivery budgets and burn allocations. Refunds reverse the relevant allocations.

Company income funds research, infrastructure and growth, including ads and disclosed paid creator/KOL promotion. It is income before costs, not net profit. Customer credit liabilities and burn reserves stay protected. Automatic burns are not live; agent credits retain the separate 70 / 20 / 10 policy.

ArcReply

FOR EXPLORERS

Your research workspace.

Save projects, compare their public evidence and check what changed since your last visit. A free launch preview with no paid AI calls.

Save and compare

Keep up to 20 projects on this browser and compare three at a time. Export public findings and source links.

Open research workspace >

Check reviewed changes

Return or refresh to compare current editorial notes with your saved baseline. Mark changes reviewed when you have read them.

Know the limits

No background alerts or automatic security investigation. Premium report ownership remains separate. New price data does not re-review research.

Browser-local preview: 20 saved projects / three comparisons. AREPLY reader pass prepared for 100 / six after wallet proof and a finalized balance check; not activated. No reader lock, paid reports or AI credits included.

ArcReply

FOR AREPLY HOLDERS

Useful tools for readers and teams.

AREPLY spending and benefits are planned; no token contract or live token checkout is published.

Ordinary users

Planned token spending on reports and research, holder discounts and expanded monitoring. No token lock proposed for ordinary users.

Projects & exchanges

Planned token-locked membership for advanced agent analytics and knowledge tools. Actual API delivery is funded separately in USDC.

A separate burn budget

Earned report and spotlight income targets 50% buyback and burn; consumed agent revenue targets 10%. Allocations are not executed burns.

Open burn tracker >

Today: free research workspace and individual 9 USDC report checkout. Future token checkout, eligibility and benefits need verified contracts and funded costs. Holding does not grant unlimited AI or all paid reports; no yield or price gains promised.

LAUNCH PLAN

A 5% treasury. Clear fee destinations.

Selected launch settings, pending the actual Argus purchase and contract deployment.

Project treasury: 5%

A paid opening purchase is planned. No tokens are owned yet. After launch, publish the treasury wallet and confirmed holdings.

2% buy / 2% sell

Portal 8 adds 1% base fee: normal total 3% per side. Argus takes 30% of that whole fee before the launch lanes.

50 / 20 / 30 lanes

Of the remaining budget: 50% creator funding, 20% buyback and burn, 30% liquidity. No dividends. These are separate from service revenue.

Reports and delivered spotlight: 50% company / 50% burn reserve. Consumed agent credits: 70% delivery / 20% operations / 10% burn. No token or burn execution is live.

RELEASE STATUS

Available, pilot and planned.

Check the status page for configuration and connection checks; it is not proof of a funded transaction.

Available now

Project and exchange directory, free research, new-launch radar, account workspace and project-specific 9 USDC premium report checkout.

Pilot / not activated

Spotlight is a fixed-price operator pilot. Paid agent credits and production community replies remain disabled pending delivery and cost checks.

Planned next

Authorized Telegram and X integrations, measured credit billing, token launch and verified buyback execution; later spotlight bidding.

Check service status >

An agent integration is not activated simply by creating a profile. Research unknowns remain explicit. No fixed launch dates or exhaustive market coverage are promised.

ArcReply

AGENT SETUP & QUALITY

Prepare privately. Prove the answers.

A useful community assistant starts with reviewed knowledge and an unambiguous client identity.

01 Add and maintain knowledge

Paste your FAQ, official links, support process and known limits. Approve sources before use. Edits return a source to review. A saved URL is a citation, not an automatic website import.

02 Test the boundaries

Check common questions, unknown facts, misleading requests and source citations. The current evidence engine retrieves exact excerpts. Natural-language AI quality requires measured evaluation before paid rollout.

03 Connect and fund safely

A verified group or account selects its own workspace. Rate limits, duplicate protection, disconnect controls and funded cost limits are required. Agent-credit collection remains disabled.

Read the detailed setup walkthrough >

Two to three weeks after token launch is a rollout target, not a promised date. X approval and live channel tests are external release gates. Holding AREPLY does not fund API usage.
